

Fall Applied Performance Guarantee

We're so confident you'll be happy with fall applied PrePass™ XC that we guarantee BOTH the fall performance AND spring results as well.

If you require a spring pre-seed burn-down application for broadleaf weeds susceptible to fall and spring SoilActive™ control, Dow AgroSciences will supply 0.375 litre per acre of Vantage™ Plus MAX II to clean up the fields as needed. Even if weed pressure and population do require a glyphosate application in the spring, you will still see the benefits of reduced weed populations and reduced impact of weed competition from the fall application of PrePass XC.

PREPASS XC FALL APPLIED PERFORMANCE GUARANTEE DETAILS

1. Apply PrePass XC after soil temperatures begin to cool in fall (late September to early October in central and northern regions, mid to late October for southern regions) until a killing frost occurs. Check on application timing with your local sales representative or the Dow AgroSciences Solutions Center at 1.800.667.3852.
2. In order to evaluate the performance, leave a reasonable-sized untreated area for comparison. (Suggested size: 20'x50'.)
3. The SoilActive™ component of PrePass XC will generally provide extended weed control for approximately 21 days of active weed growth in spring after a fall application when the timing guidelines above are followed. (To assess the SoilActive control, take note of when weed growth starts in your untreated area in the spring.)
4. If the field(s) does not have commercially acceptable broadleaf weed control prior to seeding wheat, barley or oats, the grower is asked to complete the following steps:
 - a. Inspect the field within 3 weeks of active weed growth in the spring to determine if control of susceptible broadleaf weeds is below 85% compared to the untreated area. Field inspections should take place no later than May 1 in Southern regions, or May 10 in Northern Central regions.
 - b. Call the Dow AgroSciences Solutions Center to log your guarantee claim.
 - c. As required Dow AgroSciences will provide a voucher for the purchase of Vantage Plus MAX II at a rate of up to 0.375 L per acre, up to a maximum of 640 acres.
