

FIVE REASONS WHY THE SENTRICON® SYSTEM WORKS AS A STAND-ALONE SOLUTION

By design, Sentricon is a system. The purpose of the Sentricon® system is to protect property from subterranean termites. The system eliminates the threat by eliminating the colony, including the termite queen who is the source of the threat. As a system, Sentricon does this totally and consistently, without anything else being required. The system has been proven able to eliminate any subterranean termite species that damage property. Here are the top five reasons why the Sentricon system is a stand-alone solution.

1. IT'S PROVEN TO ELIMINATE COLONIES.

Colony elimination against all target termite species has been proven over and over again through more than 60 published studies, many done by independent university researchers across the country. In addition, the proven ability to protect homes has been demonstrated by Certified Sentricon Specialists,™ who for more than 20 years have used the Sentricon system to protect more than 4 million structures across the nation.

2. IT'S A PREVENTATIVE AND CURATIVE SOLUTION.

A stand-alone termite solution has to be able to stop an active infestation, plus protect against invasions by new termite colonies. The Sentricon system excels at both. Have your customers never had termites? Keep it that way.

3. IT'S MORE DESIRABLE THAN WOOD.

Patented Recruit® HD termite bait is highly desirable to termites, nearly 10 times more so than the wood they are feeding upon. Each bait device contains more than enough active ingredient to eliminate a typical termite colony. Even on homes where multiple colonies attack at the same time, there is enough bait available to eliminate those colonies. Combine that with annual service by a Certified Sentricon Specialist, and the home is always protected.

4. IT'S A COMPLETE SYSTEM, TACKLING ABOVE-GROUND INFESTATIONS, TOO.

Above-ground infestation? Not a problem. That's where another component of the Sentricon® system — Recruit® AG FlexPack™ termite bait — comes in. The above-ground bait station is designed to be placed in direct contact with the active termites. Recruit AG FlexPack initiates the colony elimination process virtually immediately. Using a chemical spot treatment on active termites can actually slow down the colony-elimination process.

5. IT'S IDEAL FOR RESIDENTIAL, COMMERCIAL AND SENSITIVE SITES.

There are no limitations. Along with homes and commercial properties, the Sentricon system can be used with confidence even on sensitive sites. Whether it is a local retail store, a large sports arena, trees, historical properties or a 100-story skyscraper, the Sentricon system is up to the task.
